

LYMPHEDEMA: a condition of swelling caused by a buildup of fluid in the tissues. This is due to a blockage in the lymphatic system, which normally carries away excess fluid from the tissues. Lymphedema can occur in any part of the body, but it most commonly affects the arms and legs. It is a chronic condition that can worsen over time if not treated. The swelling is often accompanied by skin changes, such as thickening and discoloration, and can lead to infections and ulcers. Treatment options include compression therapy, manual lymphatic drainage, and surgery in severe cases.
