

Geographic tongue is a benign condition characterized by red, well-demarcated, map-like lesions on the tongue's surface. The lesions are typically surrounded by white, leucoplakic borders. The condition is often asymptomatic, but it can cause discomfort, especially when eating spicy or acidic foods. The exact cause of geographic tongue is unknown, but it is thought to be related to a combination of factors, including genetic predisposition, immune system dysfunction, and nutritional deficiencies. The condition is most commonly seen in adults, but it can also occur in children. The lesions can change in size, shape, and location over time, and they may recur after treatment.
