

DERMATOFIBROSARCOMA is a rare, locally aggressive, low-grade sarcoma of the skin. It is characterized by a proliferation of spindle-shaped cells arranged in a characteristic storiform pattern. The tumor is typically found in the dermis and can extend into the subcutaneous tissue. It is often associated with a thickened epidermis and a relatively large neoplasm. The tumor is composed of fascicles of thin cells and fibrous septa formed of neoplastic cells. It is often associated with a thickened epidermis and a relatively large neoplasm.
