

Poikiloderma Atrophicans Vasculare

Poikiloderma atrophicans vasculare may be seen in three different settings: (a) in association with three

The three genodermatoses in which the cutaneous lesions have the appearance of poikiloderma atroph

Poikiloderma-like lesions is a feature of early mycosis fungoides. Poikiloderma vasculare atrophicans is one of two clinical forms of mycosis fungoides.

The third group of diseases in which lesions of poikiloderma atrophicans vasculare occur are represented

Clinically, the term poikiloderma atrophicans vasculare is applied to lesions that, in the early stage, show

Histopathology .

In its early stage poikiloderma atrophicans vasculare, without respect to its cause, shows moderate thinning of the epidermis.

The amount and type of dermal infiltrate vary with the underlying cause. In poikiloderma atrophicans vasculare
