

Scabies

Acarid mites produce several skin manifestations in humans, the most common one represented by scabies.

Burrows are the pathognomonic lesions of scabies and are found mostly in the flexural, papulovesicular type.

In some patients, itching nodules persist for several months after successful treatment, and therefore are

nodular scabies or persistent scabietic nodules. They are found most commonly on the scrotum and are

In a third, rare variant, the so-called Norwegian scabies or crusted scabies, innumerable mites are present

Histopathology.
