

leiomyoma (平滑肌瘤) is a benign tumor of smooth muscle. It is most commonly found in the uterus (uterine leiomyoma) and the gastrointestinal tract. Other common sites include the skin (cutaneous leiomyoma), the bladder, and the prostate. The tumor is composed of bundles of smooth muscle cells arranged in a whorled pattern. It is typically well-circumscribed and does not invade surrounding tissues. The growth is usually slow and asymptomatic, although it can cause pain or discomfort if it is large or located in a sensitive area. Treatment is usually surgical removal, which is curative.
