

Widespread lupus vulgaris (Lupus vulgaris) is a form of cutaneous leishmaniasis occurring in individuals with a high degree of susceptibility to the parasite. It is characterized by the presence of multiple, crusted, and ulcerated lesions on the face, neck, and limbs. The disease is caused by the parasite *Leishmania tropica* and is transmitted by the bite of a sandfly. The disease is most common in the Mediterranean region, the Middle East, and parts of Africa and Asia. It is a chronic disease that can persist for many years if not treated. The disease is characterized by the presence of multiple, crusted, and ulcerated lesions on the face, neck, and limbs.
